

SOCIAL NETWORKS AND POLITICAL INTERDEPENDENCE

David A. Siegel

Course information:

Course Number: POLSCI.634.01.Sp21
Time: M 1:45 PM–4:15 PM
Place: Online Only/Zoom
Course website: Sakai

Contact Information:

E-mail: david.siegel@duke.edu
Tel: e-mail only
Office: 293 Gross Hall
OH: Th 1:30–3 pm or by appt.

Course Description

This course is a collective enterprise in building a repertoire of knowledge and skills relating to understanding the influence of social networks on political behavior and using this repertoire to answer novel network-related questions of interest. To elaborate, the course is designed to do three things: (1) impart an understanding of the myriad ways in which social networks influence political behavior; (2) impart a set of skills, largely computational in nature, designed to analyze the role of social networks in political behavior; and (3) help develop and address an original research question involving social networks and political behavior.

We will spend the first two weeks of the course briefly discussing the state of the substantive literature on the role of social networks in political behavior, with a focus on relatively recent scholarship. With this background in hand, at the end of this period we will take a week to workshop initial ideas for original research papers.

We will then turn over the next four weeks to developing an empirical toolkit intended to help us answer our own questions on the topic. Equal time will be spent on: (i) developing a solid theoretical understanding of the data and theoretical constructs and measures that comprise network analysis; and (ii) learning to work with each of these within the R programming language. At the end of this we will take a week to discuss the relevant data, constructs, and measures that are needed for our now-refined research ideas.

In the next three weeks, we will turn to the topic of computational (simulation) modeling, a technique that can be useful in general for theoretical development, and particularly so when it comes to modeling the complex interdependencies inherent in networks. Again, we will split time between theoretical development and practical skills. Specifically, we'll discuss: (i) the basics of programming simulations, with particular application to networks; and (ii) computational modeling varieties and best practices, with concrete in-class examples. At the end of these three weeks we will take a week to workshop ideas for simple computational models intended to produce, either directly or indirectly, hypotheses related to our research ideas. These models should make use of the constructs and measures identified at the end of the class's empirical section.

Finally, having built up both substantive and methodological knowledge, we will take one week to workshop each overall research project, putting together all the pieces we worked on earlier. This will provide one last opportunity for feedback before the final research paper is completed. Sixty percent of the class grade will come from this paper. The rest will be distributed between active participation over the course of the semester and two assignments.

There are no strict prerequisites for the course, as all necessary skills will be developed during it. However, students who possess an introductory (or better) level of understanding of statistics and/or programming might find the corresponding topics easier.

Readings

All readings for the class are listed in the tentative schedule below in the order in which they will be used. Any book chapters or articles not available through Duke's library or on the Internet will be posted to Sakai. Required readings are to be done before class in all cases. Students, particularly those lacking specific methodological training, should focus on the substantive contributions of the readings; we will discuss all methods in class. Required readings were chosen as a sample of important research and to illustrate points I desire to make in class. Additional recommended readings are listed below each topic on the schedule as well. These are included as a preliminary (and completely non-exhaustive) guide for further reading on the topic for those who are interested. Despite the breadth of the topic and the manner in which it spans academic disciplines, I have primarily included readings from political science sources. A more comprehensive overview of the literature in political networks may be found in *The Oxford Handbook of Political Networks*, which is available online (within Duke's network) at <http://www.oxfordhandbooks.com/view/10.1093/oxfordhb/9780190228217.001.0001/oxfordhb-9780190228217>.

This disciplinary focus is not a statement of the relative worth of political science sources as compared to others, just a nod to the focus of the course. There are longstanding traditions of network study within sociology, anthropology, and mathematics that deserve attention, as well as equally valuable, if newer, literatures in diverse fields such as economics, computer science, and physics. A few bits of work from sociology and economics do make it into the recommended readings, but for the most part you will have to seek other sources for overviews of work outside of political science.

Course Requirements

- Participation (20%): For the weeks we will discuss the substantive literature, everyone should be prepared to discuss the readings during class. I expect you to provide evidence that you have done the readings in a thoughtful and careful manner. For the weeks we will discuss methods, all students are expected to come to class with questions from the readings and/or the assignments. Most of all, for the weeks we will work on improving research projects, students are expected to participate actively in small group feedback meetings.
- Assignments (20%): There will be two assignments covering methodological topics over the course of the semester. Students will generally have two weeks to complete each. One will cover quantitative methods, the other computational modeling/computer programming. Students are welcome to work together on these, but each person's work must be written up (on a computer, not by hand) independently, and all work must represent an understanding of all problems in the assignment. You will submit each assignment to your dropbox on the course's Sakai website on its due date; no late assignments will be accepted. Solutions will be made available at this time. After this point students will have a week to figure out, with the help of the solutions, where they might have gone wrong, and why. Each student will then provide detailed comments (also by computer, in the form of comments on a text document or pdf) that identify any incorrect points and explain how each problem should have been done, and why that is the case. Students will not assign any grades, however. Students will turn in these commented problem sets at the end of the week. Students' grades on the assignments will consider both their original performance and their self-assessment. Do not put assignments off to the last minute! The earlier you start, the more help you can expect.

- Final Paper/Presentation (60%): The entire course builds to the production of a piece of original research that, if not immediately publishable, is well on its way to becoming so. The feedback students will receive at multiple occasions during the semester is intended to strengthen this work. Each paper possesses two sets of requirements. The first is that the paper must address interdependent behavior as captured in a network and contain *both* a computational model used for theory development (which may be simple, if it matches the research question) *and* an empirical test of at least one of the hypotheses derived from the model. That is, students are required to write a paper in the style of EITM: empirical implications of theoretical models. The second set of requirements is that it must be a real paper which you could submit to a journal. That means that certain components will be needed. You will need to specify the research question clearly, as well as the approach you will be taking to answer it. You will need to set your question and approach in the broader literature. You will need to describe your theory and its conclusions and derived hypothesis clearly, justifying assumptions and identifying theoretical mechanisms that underlie its conclusions. You will need a discussion of data sources, empirical measurements (and the meaning of any theoretical constructs that underlie them), method of inference and/or prediction, and results. Finally, you will need a concluding discussion that includes connections to broader themes. The technical details match those that would be present at most journals: at least 20 pages (double-spaced) but no more than 40 pages (double-spaced), 12 point font. (Limiting to 8500 words is also a good idea.) Acceptable formats include pdf and doc/docx (i.e. Acrobat and Word); it is your responsibility to ensure that the document can be opened. The final paper will be due by noon on April 28th, 2021, if you want a grade for this semester. (Should pandemic life intervene, talk to me in advance of that date.) Papers should be placed in the dropbox on Sakai, not sent to me via e-mail. Joint projects are allowed and encouraged. I do expect joint projects to show evidence of all contributors' efforts, however, and will use feedback meeting weeks to assess that.

Tentative Schedule of Readings (Subject to Change with Advance Notice):

THE INFLUENCE OF SOCIAL NETWORKS ON POLITICAL BEHAVIOR

Mass Behavior (1 week)

REQUIRED READING:

Beck, P.A., R.J. Dalton, S. Greene, and R. Huckfeldt. 2002. "The social calculus of voting: Interpersonal, media, and organizational influences on presidential choices." *American Political Science Review* 96(01): 57–73.

Levitan, Lindsey Clark and Visser, Penny S. 2009. "Social Network Composition and Attitude Strength: Exploring the Dynamics within Newly Formed Social Networks." *Journal of Experimental Social Psychology* 45: 1057–1067.

Leighley, Jan E. 1990. "Social Interaction and Contextual Influences On Political Participation." *American Politics Research* 18(4): 459–475.

Mutz, Diana C. 2002. "The Consequences of Cross-Cutting Networks for Political Participation." *American Journal of Political Science* 46(4): 838–55.

Nickerson, David W. 2008. "Is Voting Contagious? Evidence from Two Field Experiments." *American Political Science Review* 102(1): 49–57.

Ryan, John Barry. 2011. "Social Networks as a Shortcut to Correct Voting." *American Journal of Political Science*, 55(4): 753–766.

Lazer, David, Katya Ognyanova, William Minozzi, and Michael Neblo. "The social control of political participation: Conflict and contagion as processes (de)mobilizing voting." *Working Paper*.

RECOMMENDED READINGS:

Opinion Formation

Workshopping Data Sources, Measures, Network Constructs (1 week)

No readings. We will schedule small group meetings to discuss revised paper ideas and proposed theoretical network measures, theoretical constructs, and appropriate data sources.

Computationally Modeling Networks (3 weeks: basic coding; procedures and practices; hands-on examples from the literature)

REQUIRED READING:

Week 1:

Class notes on Sakai.

Week 2:

Siegel, David A. 2018. “Analyzing Computational Models.” *American Journal of Political Science* 62 (3): 745–759 with appendix at http://people.duke.edu/~das76/Research/Siegel_Analysis_AJPS_Appendix.pdf and code at <http://people.duke.edu/~das76/Research/SiegelAJPSAnalysis.zip>.

Week 3:

Class notes on Sakai, with examples drawn from the literature.

Siegel, David A. 2013. “Social Networks and the Mass Media.” *American Political Science Review* 107 (4): 786–805 with appendix at http://people.duke.edu/~das76/Research/Siegel_APSR2013_appendix.pdf.

Siegel, David A. 2011. “When Does Repression Work?: Collective Action and Social Networks.” *Journal of Politics* 73 (4): 993–1010 with appendix at http://people.duke.edu/~das76/Research/Siegel_Repression_JOP_2011_Appendix.pdf. 4

Siegel, David A. 2011. “Non-Disruptive Tactics of Suppression Are Superior in Countering Terrorism, Insurgency, and Financial Panics.” *PLoS ONE* 6(4):e18545.

Siegel, David A. 2009. “Social Networks and Collective Action.” *American Journal of Political Science* 53 (1): 122–138 with appendix at http://people.duke.edu/~das76/Research/Siegel_network_model_AJPS_appendix_final.pdf.

RECOMMENDED READINGS:

Workshopping Theory and Hypothesis Development (1 week)

No readings. We will schedule small group meetings to discuss revised ideas and related network constructs and data sources, as well as theory and derived hypotheses.

Workshopping Overall Project (1 week)

No readings. We will schedule small group meetings to discuss initial empirical results and focus of the write up.
